

Zenith Fit Sleep Guide

A simple system to sleep better, recover faster, and lose fat more easily

FOUNDATION

Why Sleep Matters (Without the Science Lecture)

When Sleep Is Poor

- Hunger increases dramatically
- Cravings become harder to resist
- Training feels heavier than it should
- Mood and motivation drop
- Stress rises, recovery slows

The Bottom Line

You can still make progress with poor sleep, but sleep is the lever that makes progress feel easier. It's not about perfection—it's about stacking the odds in your favour.

Your target most nights: 7–9 hours in bed

If life is busy, improve sleep quality first, then quantity.

The Zenith Sleep Score

Aim for 8 out of 10, not perfection. Each habit below is worth 1 point. If you hit 8, you're winning.

- 1 Same wake-up time (within 60 minutes)
- 2 Morning light within 30 minutes of waking (5–10 minutes outside)
- 3 Caffeine cut-off at least 8 hours before bed
- 4 Last meal finished 2–3 hours before bed
- 5 10-minute wind-down routine
- 6 Screens reduced or dimmed in the last hour
- 7 Bedroom cool, dark, quiet
- 8 No doom-scrolling in bed
- 9 If you wake up, you don't start thinking about tomorrow
- 10 Alcohol kept minimal or avoided

ESSENTIAL

The 3 Non-Negotiables

If you do nothing else, do these three things. They form the foundation of everything else.

1. Fixed Wake-Up Time

Set your wake-up time and protect it. Even if your bedtime changes, the wake time anchors your body clock. Consistency here matters more than anything else.

2. Caffeine Cut-Off

Caffeine lasts longer than people think. If your sleep is lighter or you wake more, this is usually the first fix. Rule: no caffeine after midday, or 8 hours before bed.

3. A Wind-Down Ritual (10 Minutes)

Your nervous system needs a signal that the day is done. Not a full spa routine. Just a repeatable switch-off that tells your body it's time to rest.

Your 10-Minute Wind-Down

Pick one option from each row. Keep it boring. Boring works.

Option A: Body

1–2 minutes slow breathing or light stretching for hips, back, chest. Or a hot shower.

Option B: Brain

Write 3 bullets: what went well today, what needs doing tomorrow, one thing I'm grateful for. Or read 5 pages of a book.

Option C: Environment

Lights down, phone out of reach, clothes ready for tomorrow, water by the bed.

SETUP

The Bedroom Setup

Small changes, big impact. Your environment shapes your sleep more than you think.

Temperature

Cool room helps you fall asleep faster and stay asleep. If you wake up hot, fix this first: lighter duvet, cooler room, fan.

Darkness

If you can see your hand, your room is too bright. Use blackout curtains or a sleep mask. Darkness signals your brain that it's time for sleep.

Sound

If noise wakes you, use white noise. If your mind wakes you, use the wind-down routine instead.

Phone Rule

The bed is for sleep and recovery. Charge your phone away from the bed if you can. This one habit changes everything.

Food, Training, and Alcohol

Food and Sleep

Finish eating 2–3 hours before bed. Going to bed stuffed often causes lighter sleep and waking.

If you get hungry at night: Don't fight it with willpower. Plan it. Have a small protein-based snack 60–90 minutes before bed if needed.

- Greek yoghurt
- Protein shake
- Cottage cheese
- Turkey or chicken slices

Training and Sleep

Training helps sleep, but timing matters.

If you train late and feel wired after:

- Finish training at least 2 hours before bed if possible
- Cool shower after training
- No pre-workout after mid-afternoon
- Add a 5-minute slow walk after training to downshift

Alcohol and Sleep

Alcohol can make you fall asleep faster but reduces sleep quality.

If you drink, use this rule:

- Two-drink maximum
- Stop at least 3 hours before bed
- Drink water before sleep
- Expect slightly worse recovery the next day and plan accordingly

What to Do When Sleep Won't Come

Can't Fall Asleep

Use the 20-minute rule: If you're awake for roughly 20 minutes, get out of bed. Low light only. No phone. Read something boring or do slow breathing. Return to bed when sleepy again.

Do not lie there fighting sleep. That trains your brain to associate bed with being awake.

Wake Up in the Night

First, do nothing dramatic. Waking is normal.

1. Don't check the time
2. 10 slow breaths, in through nose, out longer than in
3. Relax jaw, shoulders, hands
4. If you're still awake, use the 20-minute rule above

Wake Up at 3am

Often one of these: stress, alcohol, temperature, late caffeine, late heavy food, inconsistent wake time. Identify the culprit and adjust.

7-Day Sleep Reset

Do this once, then keep the best parts. You'll feel the difference by day 4–7.

❑ **The Weekend Rule:** Most people destroy sleep Friday to Sunday and then feel broken Monday. Wake-up time stays within 60 minutes. Bedtime can move, wake time stays stable. This one rule will upgrade your week.

Your Sleep Commitment

Copy and complete this. Make it specific. Make it yours.

My wake-up time is:

My caffeine cut-off is:

My wind-down starts at:

My 10-minute routine is:

My sleep score target is:

8 out of 10

Troubleshooting Checklist

If sleep is still poor, tick these off. Fix the obvious before overcomplicating it.

- Are you having caffeine too late?
- Are you going to bed stressed without a wind-down?
- Are you going to bed too hot?
- Are you eating too close to bed?
- Are you scrolling in bed?
- Is your wake time inconsistent?
- Are you drinking alcohol regularly?
